ABSTRACT

The purpose of this study is to identify concept mastery and scientific literacy capability of senior high school students. This study use quantitative-qualitative mix method. This study was conducted on senior high school students in Kudus Regency. The subjects of this study were 12th grade student who have received all the subject matter of physics. The instruments of this study is concept-based and scientific literacy-based multiple choice test accompanied by the reason. The level of concept mastery and scientific literacy capability of students is analyzed through the appropriateness of the choice of answers with the reasons. The results shows that the lowest level of concept mastery and scientific literacy capability of senior high school students is item SKL 3 about heat and thermodynamics. From the results can conclude that concept mastery influences the students' scientific literacy capability.

Keyword: Concept mastery, Scientific literacy, Senior high school students

1. INTRODUCTION

The progress of science and technology in various countries is rapidly increasing on 21st century [1]. Science became one of foundations of life [2]. This makes science very important to study in high school level. Science can not be separated from every human activity and various phenomena that occur in the natural environment [3]. Specifically, the term “science” is interpreted as Natural Science (IPA) related to the effort to understand various phenomena of nature systematically [4]. Science is one study that seeks to understand something that exists in nature based on empirical data [5]. The basic ideas contained in science fit the verifiable facts.

Science education builds students’ way of thinking to understand phenomena or natural events by scientific methods such as those conducted by scientists [6]. The main goal of science education is to teach scientific concepts and processes, thereby helping students develop a strong understanding of scientific findings as well as the skills and processes used in science [7]. Science education aims to increase the competence of learners as an effort to meet the needs of life in various situations [8]. Studies related to science education have been widely developed, one of them through the Program for Intercountry Student Assessment (PISA) conducted by the Organization for Economic Co-operation and Development (OECD). Science education develops various abilities in the field of science, one of which is science literacy.

Scientific literacy has become a widespread concern for scientists, lecturers, and public policy holders [9], as it is indispensable for modern societies to cope with the problems of science and technology [10], as well as to support sustainable development [11]. Scientific literacy is a capacity for using science knowledge, identifying questions and drawing factual inferences to understand the universe and making decisions about changes occurring due to human activities [12]. Scientific literacy is an element of life skills that must be key outcome of educational process until the child is 15 years old. For that reason, a 15 years old (end of compulsory education) is deemed necessary to
have an adequate level of scientific literacy, whether to pursue science or non-study [13]. Scientific literacy
classified into four categories, namely science as a body of knowledge, science as a way of thinking, science as a
way of investigating, and the interaction between science, technology, and society [14]. The development of
scientific literacy is needed in order to prepare students who are literate in the field of science [15]. This condition
encourages researchers to conduct preliminary research in order to obtain information about concept mastery and
scientific literacy capability of high school students. The results of this study become a consideration to develop
science-based literacy learning tools that are valid, practical, and effective to improve students' scientific literacy
capability.

2. METHOD
Method of this study is use qualitative-quantitative mix method. The subject of this study were 12th grade students of
senior high school in Kudus Regency. This study was conducted in January 2018. The instruments of this study is
concept-based and scientific literacy-based multiple choice test accompanied by the reason. Question of test
compiled according to Graduate Competency Standards (SKL) of physics in senior high school. Concept-based test
and scientific literacy-based test derived from PISA test and scientific literacy-based test that have been developed
by previous researchers. The results of students’ answers were analyzed to know concept mastery level and
scientific literacy capability of students. Based on the results obtained, conducted interviews as a form of
confirmation about students’ answers. The purposes of interviews is to identify the factors that influence concept
mastery level and scientific literacy capability of students.

3. RESULTS AND DISCUSSIONS
This study is preliminary research to know the level of concept mastery and scientific literacy capability of senior
high school students. The percentage of correct answers and correct reasons for concept-based test are presented in
Table 1.

Table 1 presents the percentage of correct answers and correct reasons given by students on each SKL. This
percentage describes the level concept mastery of senior high school students. Based on all questions tested to
students, the percentage of correct reasons is always less than percentage of correct answers. The lowest percentage
of answers and reason is on SKL 3 related to heat and thermodynamic. On concept-based test of SKL 3, students are
given problems about heat. In accordance with indicator test, students are expected to be able determining
temperature of water mixture using black principle. The concept-based test of SKL 3 is presented in Figure 1.
Figure 1 presents concept-based test of SKL 3 about heat. Test assigned to students classified into C3 difficulty level (application) on Bloom taxonomy. Students are expected to be able analyzing and applying *black principle* in water mixture that have different temperatures. Result of student's answers can be seen in Table 2.

Table 2 shows that majority of students choose answer B on concept-based test of SKL 3. Question of concept-based test for SKL 3 can be solved using *black principle*. This principle applies when there is mixing of 2 objects that have different temperatures. The amount of heat received by an object 1 is as same as the amount of heat released by the object 2. On the concept-based test of SKL 3, mixing occurs between hot and cold water. In accordance with *black principle*, the mixing causing hot water removing heat to lower temperature. Conversely, cold water receives heat to raise their temperature. Only 36% of students were able to answer concept-based test of SKL 3 correctly. Students who can answer the reason exactly is only 17%. This result indicates that concept mastery of senior high school students on SKL 3 is not good enough.

Identification of students' scientific literacy capability has been done by providing scientific literacy-based test for students. The percentage of correct answers and correct reasons for scientific literacy-based test are presented in Table 3.

Table 4 shows that majority of students choose answer A on scientific literacy-based test of SKL 3. Scientific literacy-based test of SKL 3 reviews about phenomenon of convection heat transfer in daily life. The convection occurs on the air in car cabin due to warming by solar radiation. The heat from solar radiation will be spread evenly in the car's cabin by the gas substance, i.e. air. Convection that occurs affects the objects contained in system, in this case is car cabin. All objects in car cabin will have the same temperature after convection process. The majority of students have answered scientific literacy-based test of SKL 3 correctly, by 40%. Only 11% of students are able to give reason appropriately. Students know that the state of objects in car cabin will have same temperature after 3 hours in car cabin. But students can not explain the heat transfer process that occurred. Based on the percentage of students' answers, it can be concluded that scientific literacy capability of senior high school students is not good enough. Students have not been able to explain the reason for answer the problem well according to the theory. Comparison the percentage of students' correct answers between concept-based test and scientific literacy-based test is presented in Chart 1.
Figure 3 shows that the percentage of correct answers in concept-based test is higher than scientific literacy-based test in all SKL. Based on interviews with students, it found the fact that learning carried out by teacher refers to concept and calculation only. Teachers provide physics material based on books and worksheets without develop it in the other strategies like experiment or discussion. Students only accept simple concept and mathematical calculation without being explained about physical meaning. Students' habits in learning concepts make students' thinking levels more likely to know and apply in simple conditions [16]. Science education curriculum must be according to students' condition and environment [17]. Science should be taught based on students' experiences, attitudes, and self efficacy [18]. Time limitation is the most popular reason why teachers do not experiment in laboratory. Science education implemented in schools emphasizes abstract conceptualization and less active experimentation, whereas both should be proportionally balanced [19].

The level of concept mastery and scientific literacy capability of students have same trend. Achievement of students' scientific literacy capability is proportional to level of concept mastery. Descriptively, it can be concluded that the level of students’ concepts mastery affect the achievement of students' scientific literacy capability. Scientific literacy of students can grows supported by reading interest and learning concept mastery [20].

4. CONCLUSIONS
Identification of concept mastery of concept and scientific literacy capability of senior high school students has been done. The results showed that concepts mastery and scientific literacy capability of senior high school students is not good enough. The lowest students’ concepts mastery level and scientific literacy capability is on SKL 3 about heat and thermodynamics. Students’ concepts mastery influences their scientific literacy capability. Trends of research results show both have a relationship and influence each other. This research results will be base for development of scientific literacy instrument evaluation for senior high school students.
