DESIGN AND ANALYSIS OF GRASS CUTTING MACHINE

Mr. Jigar Rajendrakumar Shah
1. Lecturer in Mechanical Engineering Department, SB Polytechnic, KJ Campus, Savli

ABSTRACT

Now a days grass cutting is important stage in agriculture field. Currently in India former used conventional method for the grass cutting purpose. i.e manually cutting using labor but this method is lengthy and time consuming. This project aim is to design and analysis of small field grass cutter machine for small height grass. To analysis cutting roller and horizontal cutting blade by using Pro-e and anises software. The machine consists of petrol engine to operate cutting roller and blade. When compare to manual grass cutting by and this machine has a capacity to cut the grass in faster. This machine to helpful for both the small as well as big farm.

Keyword : Manual method, Mechanized method, Peak working, Grass cutting.

1. INTRODUCTION

Agriculture is the backbone of India. In India agriculture has facing serious challenges like scarcity of agricultural labour, in peak working seasons but also in normal time. This is mainly for increased nonfarm job opportunities having higher wage, migration of labour force to cities and low status of agricultural labours in the society. In India two type of grass cutting like as manual method (conventional method) and mechanized type of grass cutter. The grass cutting is important stage in agriculture field. Currently Indian former used conventional method for grass cutting i.e. cutting grass manually using labour but this method is very lengthy and time consuming.

To design and analysis the grass cutter machine which is help to the Indian former which is in ruler side and small farm. It will reduce the cost of grass cutting in field. It will help to increase economical standard in Indian former. The design of the grass cutting machine will be presented by using KERO drawing software. The force analysis on the cutter blade. The force analysis on the roller cutter blade by using ANSYS 14.0 software. This rendered the cutter safe from the cutting forces.

2. PROPOSED SYSTEM

2.1 Field Survey

Present method of Grass cutting is important stage in agriculture field. Currently Indian former used conventional method
2.2 Manual method of grass cutting

To the cutting and threshing machine for seed separation this method the grass are remove as mentioned in the traditional method. These method grass are tied together to form a bundle. These bundles are garnered and taken to threshing machine. This machine separates the seed from the grass.

2.3 Combine grass cutting machine

The combination of grass cutting machine is to combine the three operations like as cutting, reaping and winnowing into single process. It is combination of grass cutting machine most of the economically labour saving.

3. METHODOLOGY

Methodology is the systematic, Theoretical analysis of the methods applied to a study or to the theoretical analysis of the method and principles associated with branch of study.
1. Studying the present mechanisms.
2. Field Survey
3. To identifying the potential problem.
4. Problem definition.
5. Literature review.
6. Design of grass cutter.
7. Calculation.
4. STUDYING THE PRESENT MECHANISMS.

Background

A) Agricultural farm Machinery and Equipment:
Manual labour takes time and is not effective as they can work for 3 to 4 hours at a stretch. Even if the land holding is small, it takes two or three days to completely harvest the soybean grass. Also, the planting is not done with proper care. The machine focuses on the project to make a combination of harvesting and collecting machines for small scale farmers in India who have land holdings less than two acres, to harvest grains more efficiently.

The level of mechanization has been increasing steadily over the years due to the joint efforts made by the Government and the private sector. As a result of different programs implemented by the Government of India over the years, the total farm power availability is estimated to have increased from 0.295 kw/ha in 1971-72, 1.72 kw/ha in 2010-11. (1)

B) Land holding.
Even though the adoption of farm mechanization is increasing in India, it is mostly region specific. Farm mechanization has very low growth rates in regions such as hilly and sloppy areas. The decreasing trend in operational landholding is also observed in the growth of agricultural mechanization. High costs of machine and maintenance, non-availability of appropriate agricultural machines and equipment that cater to the needs of small scale farmers, non-availability and difficulty in getting bank credit and small landholding are some of the factors that hinder farm mechanization and force farmers to follow traditional ways of agricultural operations. The use of farm machinery is also dependent on infrastructure and services available in rural areas. India continues to be fed by small and marginal farmers. Their holding (those below two hectares) taken together account for 84.97% of total holdings in 2010-11 compared with 83.29% in 2005-06, the combined area under these myriad farmed plots is 44.31% of the country’s total farmed area (it was 41.14% in the 2005-2006) (1)

5. LITERATURE REVIEW

a. Various approaches have been proposed for improving mechanized type of grass cutter in agriculture field. Designing a reaper machine to harvest grains more efficiently. The research work focusing on harvesting operation to the small land holder to cutting varieties of grass in less time and at low cost by considering the factor as power requirement, ease of operation, field condition, time of operation and climatologically condition. By the study Mr. P. B. Chavan, Mr. D. K. Patil, Mr. D. S. Dhondge (2)

b. To increase the productivity and profit. How to cutting reduce the cost and how to solve the problem comes from workers. It is fabricated for cutting various grass varieties during the time cutting to the “FABRICATION AND PERFORMANCE TEST OF AN ULTRAPORTABLE GRASS CUTTER by G Maruthi Prasad Yadav, GMD Javeed Basha (3)

c. This fabrication model small scale sugarcane harvesting machine consists petrol engine and mechanisms are used in this machine to compare to manual harvesting by using this machine has capacity to cut sugarcane in faster rate and economical. This study done by the Adarsh J. Jain, Srinivas Rarod, Vinay N Thotad and Kiran (4)

d. In this research work was made to investigate the cutting energy and force required for the pigeon pea grass. The commercially available blade it has been attached to the lower end of the arm of pendulum type dynamic tester which cut the stalk at 900 to the stalk axis with knife velocity ranging between 2.28m/s to 7.23 m/s the diameter of stem at 42.6 % (wb) moisture content. The cutting force I directly proportional to cross sectional area “stem cutter was design and developed by Atul R. Dange, S. K. Thakare, I Bhaskarao and Umarfarooq momin. (5)

6. DESIGN OF GRASS CUTTER.

In this project the idea is to make the mechanization of small scale grass cutting machine. The machine focuses on combination of cutting and collecting the grass for small scale farmers. Different parts of a machine will be mounted on strong chassis. The wheel will be attached to this chassis. The petrol engine is mounted on the chassis which provides the power to the wheels to move by chain drive and gear.

### 8 RESULTS AND IMPLEMENTATION

From the observation on rolling cutting blade and cutting blade, it is understood that all the problem with the material property and design.

At first the study of the cutters has to carried out. After feasibility study of blades. We have to design the existing and the proposed design using the modeling softer ware KERO. After the modeling process the analysis of the existing and modified design with varying material property will be made. The material property for these steel tabulated below.

9. CONCLUSIONS

The grass cutting machine to develop is just concept. It innovative three stage grass cutting machine ling the like as cutting the grass, Reaping, and winnowing. In this paper to design and analysis different cutting equipment like as roller grass cutting and cutting blade. The machine can be run on petrol engine .the machine operated by single labor. The machine will eliminate the labor problem in peak session for grass cutting period. This machine is helpful for the both the small as well as big farm.
